

April 21, 2026

The Honorable Shelley Moore Capito
Chair
Subcommittee on Labor, HHS, and
Education
Senate Appropriations Committee
Washington, D.C. 20510

The Honorable Tammy Baldwin
Ranking Member
Subcommittee on Labor, HHS, and
Education
Senate Appropriations Committee
Washington, D.C. 20510

Dear Chair Capito and Ranking Member Baldwin,

As you begin consideration of Fiscal Year (FY) 2027 Labor, Health and Human Services, Education, and Related Agencies appropriations legislation, we ask that you provide robust funding for a comprehensive federal response to antimicrobial resistance (AMR), commensurate with the threat AMR poses to patient care, public health and health readiness. We must continue to improve our defenses against this escalating health crisis.

Drug-resistant infections sicken more than 3 million individuals and kill nearly 170,000 people annually in the U.S.¹ The burden of resistance is likely much higher, but our surveillance is not able to capture the full picture. National healthcare costs linked to infections from 6 of the 18 biggest AMR threats are estimated to be more than \$4.6 billion annually. \$1.9 billion of these costs are estimated to be borne by Medicare.²

AMR is rendering lifesaving medicines ineffective, jeopardizing medical procedures that rely on antibiotics, including cancer chemotherapy, caesarian sections, other surgeries, and the treatment of serious wounds and burns. Sepsis, the body's response to untreated infections that can result in organ failure and death, is the second leading cause of pregnancy-related deaths, accounting for nearly 13% of pregnancy-related deaths in the U.S.³ AMR exacerbates the risk of sepsis by making infections much more difficult to treat. Infections are a primary or associated cause of death in 50% of patients with cancer, as AMR can make these infections difficult or

³ "Pregnancy and Childbirth," Sepsis Alliance, March 24, 2026, <https://www.sepsis.org/sepsisand/pregnancy-childbirth/#:~:text=According%20to%20the%20World%20Health,deaths%20in%20the%20United%20States.>

impossible to treat.

Military conflicts accelerate the spread of AMR and pose a significant threat to servicepeople, as combat wounds and burns can easily become infected. As soldiers and others travel from war-torn regions, it is easy for resistant infections to spread and to reach the U.S. Penetrating wounds from explosives often embed a significant amount of shrapnel in a soldier's body, which can be challenging to remove in the field and can also be contaminated with drug-resistant bacteria. Addressing AMR is central to our military readiness.

It is estimated that 30 to 50% of antibiotic prescriptions are inappropriate. Preserving the effectiveness of antibiotics, by reducing overuse and misuse, must also be prioritized. For example, smaller rural hospitals use antibiotics just as much as larger hospitals and these hospitals face unique challenges with stewardship programs due to limited resources. The pipeline of new antibiotics in development is insufficient to meet patient needs. The imminent collapse of the antibiotic market is exacerbating this threat, and small companies that are responsible for nearly all current antibiotic innovation are facing bankruptcy because factors unique to antibiotics, including the need for judicious use, make it challenging for companies to earn a return on investments in antibiotic research and development.

Congress must provide funding to reduce the burden of AMR, including:

Assistant Secretary for Preparedness and Response (ASPR)

- **Biomedical Advanced Research and Development Authority, Broad Spectrum Antimicrobials and CARB-X:** The BARDA broad spectrum antimicrobials program and CARB-X leverage public-private partnerships to develop innovative products that prevent, detect, and treat resistant infections. These efforts have led to new FDA approved antibiotics. Despite this progress, the pipeline of new antibiotics in development is insufficient to meet patient needs and robust funding is needed to prevent a post-antibiotic era.
- **Project BioShield Special Reserve Fund (SRF), Broad Spectrum Antimicrobials:** The Project BioShield SRF supports the response to public health threats, including AMR. BARDA and NIAID efforts have been successful in helping companies bring new antibiotics to market, but those companies now struggle to stay in business and numerous filed for bankruptcy in recent years, with others on similar trajectories. Full funding is needed to expand this approach to better support the antibiotics market.

Centers for Disease Control and Prevention

- **Antibiotic Resistance Solutions Initiative:** Without substantial investments in ARSI, states and local jurisdictions will lose much of their capacity to prevent, detect, and respond to drug-resistant superbugs which will put patients and communities at significant risk. Since 2019, the AR Lab Network across the country has done more than a million different tests to detect AMR threats. With ARSI funding, state, territory, and city health departments have supported nearly 300 antimicrobial stewardship activities

across inpatient and outpatient healthcare facilities, supporting more than 15,000 healthcare personnel to improve antimicrobial use.

- **National Healthcare Safety Network (NHSN):** Full funding is needed to modernize and automate NHSN to alleviate reporting burden and speed access to actionable data. Funding would bolster data collection on antibiotic use and resistance in healthcare facilities and provide technical support for more than 65,000 users of NHSN.
- **Advanced Molecular Detection Initiative:** Funding would ensure continued innovation in the detection and tracking of existing and emerging pathogens. Funding would also enable federal, state, and local public health laboratories to expand the use of pathogen genomics, sustain important partnerships with academic research institutions, and bolster training to ensure integration of genomics into infectious disease surveillance and response, including resistant pathogens.
- **Division of Global Health Protection:** Full robust funding is needed to improve global capacity to identify and stop threats before they reach U.S. soil and address growing drug resistance in low-income countries.

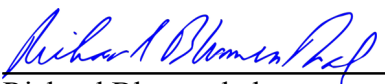

National Institutes of Health (NIH)

- **National Institute of Allergy and Infectious Diseases:** Robust funding would allow NIAID to address AMR while carrying out its broader role in supporting infectious diseases research. Increased funding would support the training of new investigators; strengthen clinical trial infrastructure; and enhance basic, translational and clinical research on mechanisms of resistance, therapeutics, vaccines and diagnostics.

There is an urgent need for continued action on antimicrobial resistance. We urge you to prioritize robust, full funding for AMR as the FY2027 appropriations process moves forward.

Thank you for your consideration of this request.

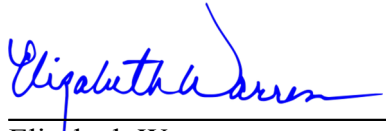

Sincerely,

Richard Blumenthal
