After months of being shuttered due to stay at home orders and/or advisories that were implemented to slow the spread of the novel coronavirus 2019 (COVID-19), businesses are re-opening and individuals along with friends and families are trying to navigate how to safely engage with society. States across the country are in different stages of re-opening and have developed various policies and guidance for their residents. Despite these guidance documents, as states lift public health measures we are starting to see increases in COVID-19 cases across the country. As states re-open, some are seeing increases in COVID-19 cases with an increasing percentage of positive tests indicating sustained community transmission.ii

COVID-19 will remain in communities at least until there is a safe, effective and widely available vaccine and likely longer. As activities resume, strong national guidance based on the latest medical and scientific information on COVID-19 transmission and risks is critical to empower individuals and communities to protect themselves from COVID-19. This guide provides information on how to slow the spread of COVID-19 in addition to guidance for engaging in daily and recreational activities safely.

**PREVENTING THE SPREAD OF COVID-19**

SARS-CoV-2, the virus that causes COVID-19, is primarily spread through close person to person contact by respiratory droplets that become airborne by sneezing, coughing, talking, or singing. Transmission can be limited by physical distancing (i.e., maintaining at least 6 feet from other people) and covering your mouth and nose with cloth face covering or mask to prevent transmission.iii The virus also may be spread through other ways such as touching a surface that has the virus on it, and then touching your mouth with contaminated hands. This is why regularly cleaning and disinfecting surfaces (particularly those often touched) is important.

Scientists estimate that the shutdown of schools and businesses along with restrictions on activities outside of the home prevented at least 530 million COVID-19 infections.iv While shutdowns have been effective at slowing the spread of the virus, there have been serious economic consequences and major disruptions to daily life. Therefore, it is important to find ways to support businesses and engage in social activities while also limiting the spread of the virus.

Once viral transmission is under control, generally defined as less than one transmission to another person by a person infected (also known as the basic reproductive number, or R0), falling below 1.0),v the consistent use of masks and strict physical distancing requirements (along with widely available testing and contacting tracing) are critical.vi

---

**Slow the Spread of COVID-19 - Protect Yourself and Others**vii

- Maintain a physical distance of at least 6 feet from non-household members.
- Wear a mask or a cloth facial covering when in public places where you will be around people.v
- Wash your hands with soap and water for at least 20 seconds or use hand sanitizer (at least 60% alcohol) routinely after touching surfaces or leaving home.
- Meet or engage in activities outdoors whenever possible while maintaining physical distance.
- Routinely wipe down high touch surface areas.
- Wear gloves when caring for someone or cleaning but otherwise are generally not needed.vi *Gloves are not a substitute for hand washing or use of hand sanitizer.*vii
- Stay home if you do not feel well.

---

1Until there is a robust supply available, surgical masks and N-95 respirator masks should be prioritized for healthcare workers and populations at higher risk due to severe shortages.
**Children and COVID-19**

Overall, COVID-19 cases have been milder in children compared to adults, but a small percentage of children age 2 to 15 have developed serious illness (known as ‘multisystem inflammatory syndrome, or MIS-C). Because symptoms in children are milder and, in some cases, asymptomatic, they may have COVID-19 infection and unknowingly spread it to others who may be at risk for serious illness.

The pandemic also is threatening the health of children by causing a steep decline in routine vaccination rates for other serious but preventable diseases, including measles, whooping cough and influenza. Parents are strongly encouraged to take children to their pediatricians or pediatric healthcare providers to stay up-to-date on their vaccinations.

**Guidance for Children**

- Children should follow the same physical distancing recommendations as adults.
- Children 2 years and older should wear a cloth facial covering or mask in public spaces.
- Ensure children remain up to date on their routine healthcare and vaccinations.
- Keep high touch (doorknobs, counters, light switches, cell phones, remote controls) surfaces clean by regularly wiping them down with disinfectant.
- Clothes and washable toys should be regularly laundered.
- Avoid playgrounds due to the challenge of keeping surfaces clean and limited space to physically distance.
- Limit interactions with populations at higher risk (e.g., elderly, immunocompromised).
- Limit interactions with other children.

**Extra Precautions for Higher Risk Populations**

Individuals with underlying medical conditions have a higher rate of severe outcomes caused by COVID-19. According to the CDC, hospitalizations have been 6 times higher and deaths 12 times higher for individuals with underlying conditions. The most common underlying conditions that put individuals at higher risk of severe disease are cardiovascular disease (high blood pressure and coronary artery disease), diabetes, chronic lung disease (asthma, emphysema), and obesity. Other conditions that may put individuals at higher risk are liver disease, kidney disease, blood disorders sickle cell disease and individuals who are immunocompromised (HIV, malignancy, transplant recipients) and pregnancy. Seniors and individuals with these conditions should take additional precautions to protect themselves and avoid contact with non-household members.

**Guidance for Older Individuals & Individuals with Underlying Conditions**

- Maintain a safe (at least 6 foot) distance from others, wear a mask or facial covering in public places and limit interactions outside of your household.
- Continue your medications unless advised otherwise by your healthcare provider.
- Maintain at least a two-week supply of prescription and non-prescription medications.
- Discuss with your provider options for reducing trips to the pharmacy, such as a 60 to 90-day medication supply, mail order or home delivery.
- Be sure your vaccinations are up to date.
- Avoid trips to the grocery store and other businesses and if possible use contactless delivery, see if someone can go for you or go during special hours for seniors and other groups.
- Do not avoid getting care including emergency care. Medical office and hospitals are taking extra precautions to protect patients from COVID-19.
- Contact your healthcare provider if you do not feel well or think you may have COVID-19.
